EngageAdvantage™ Platform Helps Improve Patient Outcomes

Vree Health has launched its new EngageAdvantage™ platform, designed to help health care providers lower costs, improve patient outcomes, and optimize resources and communication across the entire care team.

Specifically, EngageAdvantage integrates patient health care information, personalized follow-up care plans developed by the patient’s health care provider, and specially trained care liaisons (who are not health care professionals) to help health care systems optimize the delivery of care and motivate patients in the management of their own health.

One key component in this effort is adherence to a care plan. In a Vree Health pilot study currently underway at a hospital in the northeast United States, a post-program survey showed that 95% of enrolled patients who completed the Vree Health program indicated that it helped them stay on track with their recovery plan.

Through EngageAdvantage, health care providers, patients, and caregivers have access to up-to-date information. In addition to technology-based care management tools, the solution provides care liaisons, who help monitor, motivate, and support patients, while also facilitating and coordinating follow-up care.

The platform can be customized to help manage challenges related to readmission reduction.

According to the Centers for Medicare and Medicaid Services, approximately one in four Medicare patients is readmitted to the hospital within 30 days following a diagnosis, adding billions of dollars to health care costs.
