

## New System Automates Management of Beds for In-Patient Admissions Teams

Advanced Data Systems Corp. (ADS) has announced the release of Medics BedManager™, a comprehensive and intuitive software solution that automates the management of beds for health care in-patient admissions teams.

BedManager is designed for flexibility. Its single view window enables users to see the following at a glance:

- real-time status of beds occupied, including the patient's name and gender;
- bed size, type, and location, including the room and floor numbers; and
- patient/client treatment program, if applicable.

As a bed's status is updated in the system, the update information is immediately viewable by users across the enterprise in real time. A built-in report generator provides bed management reports, data, and graphics.

## RF Technologies® Releases New Fall Management Solution Products

RF Technologies® has announced the release of new products for their Sensatec® Fall Management Solution.

The restraint-free solution monitors patients or residents at risk of falling. Newly launched products include foldable bed and chair sensor pads, a toilet sensor pad, and a seat belt sensor.

The foldable sensor pads and seat belt sensors connect to Sensatec alarm units to alert staff if an at-risk patient or resident tries to get up without assistance. When a sensor is triggered as a result of a patient or resident attempting to get up without assistance, an alarm sounds at the alarm unit.

The new products are made with non-slip, latex-free material. Pads include a protective connector plug.

BedManager also handles automatic charge posting at time of discharge, ensuring claims and billing are ready to submit immediately and accurately.

Medics BedManager is available as a feature with ADS' MedicsPremier™ ICD-10 compliant practice management system. It

is also available as a stand-alone application for integration with other systems.
